Lecture 4 Energy and Energy Transfer

OUTLINE

Energy and Energy Transfer

- > Work Done by a Constant Force.
- > Work Done by a Spring.

Kinetic Energy and the Work--Kinetic Energy Theorem.

- Potential Energy
- > Potential Energy of a System.
- Elastic Potential Energy.
- The Conservation of Energy.

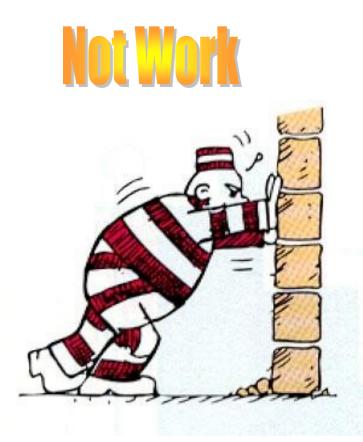

- Energy is the ability to do work, there are many forms of energy.
- Whenever you do work you transfer energy from one form to another.
- > It can only be observed when it is transferred.
- ≻ Is a <u>scalar quantity</u>.
- Measured in:
 - ➢ Joule (J), in SI system.
 - > Erg , in CGS system. (1 erg = 10^{-7} J)

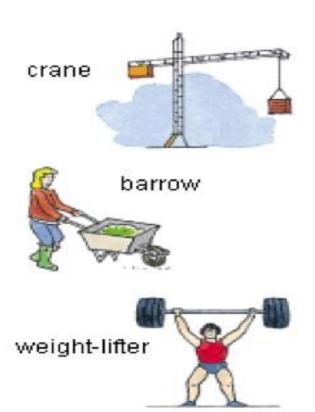

4

Work is the force necessary to move an object a distance.

model train

1. Work Done by a Constant Force:

5

> If the constant force F is in the same direction as the displacement, the work W done on an object is:

$$W = F\Delta r$$

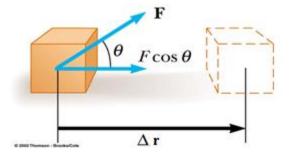

> If the constant force F makes an angle θ with the direction of the displacement, the work W done on an object by this force is:

$$W \equiv F \Delta r \cos \theta$$

Conclusion:

- Work is a scalar quantity.
- Its units are force's unit multiplied by length's unit $(N \times m)$.

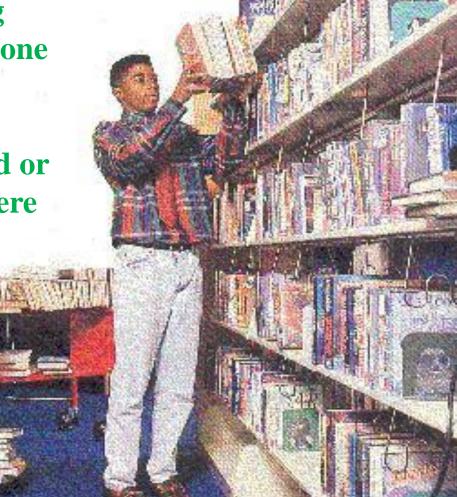

Therefore, the SI unit of work is Joule = **N.m** and the CGS unit of work is erg = erg. cm

Is there any work done ?

•When the book are being lifted, is there any work done on it?

•When they are being held or carried horizontally, is there any work done on them ?

Is there any work done ?

*****Work is done on the books when they are being lifted, (F // Δx)

*****But no work is done on them when they are being held or carried horizontally. $(\Delta x = 0)$

The sign of the work:

<u>The sign of the work</u> depends on the direction of F relative to Δr .

If **F** and $\Delta \mathbf{r}$ in the same direction the work done is Positive W > 0

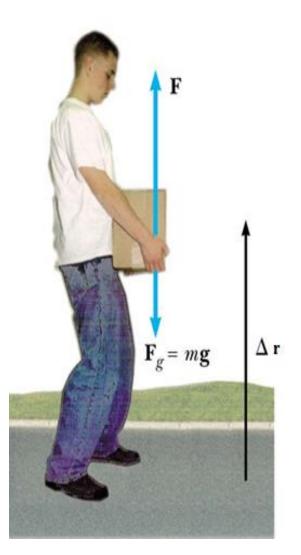

If **F** and Δr in the opposite direction the work

done is Negative W < 0

The sign of the work:

9

- Man does positive work lifting box, because applied force is in same direction as the displacement.
- Man does negative work lowering box.
- Gravity does positive work when box lowers.
- Gravity does negative work when box is raised.

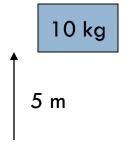

Example 1:

10

Ex.1: How much work is necessary to lift 10 kg 5m in the air?

Choose: 1) 10 N 2) 50 J 3) 490 J 4) 4900 J

<u>The answer is:</u> $W = F\Delta r$

 $F = mg = 10kg \times 9.8 \frac{m}{s^2} = 98N \rightarrow W = 98N \times 5m = 490J$

Example 2:

A student lifts a 50 pound (lb) ball 4 feet (ft) in 5seconds (s).

How many joules of work has the student completed?

Convert English units to SI units 1lb = 4.45N 1ft = 0.305m $50lb \times 4.45 = 222.5N$ $4ft \times 0.305 = 1.22m$ Solve for Work $W = F \times \Delta r$ $W = 2222.5N \times 1.$ W = 271.45J

Example 3:

12

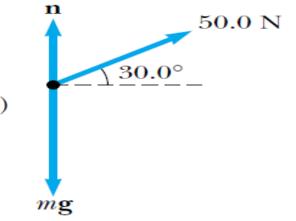

A man cleaning a floor pulls a vacuum cleaner with a force of magnitude F= 50.0 N at an angle of 30.0° with the horizontal. Calculate the work done by the force on the vacuum cleaner as the vacuum cleaner is displaced 3.00 m to the right.

Ans:

$$W = F \Delta r \cos \theta = (50.0 \text{ N}) (3.00 \text{ m}) (\cos 30.0^{\circ})$$

$$= 130 \,\mathrm{N} \cdot \mathrm{m} = 130 \,\mathrm{J}$$

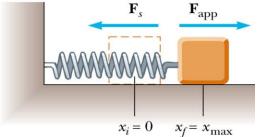

2. Work Done by a Spring:

13

If the spring is either stretched or compressed a small distance from its un-stretched (equilibrium) configuration, it exerts on the block a force that can be expressed as: $F_s = F_s$

$$F_s = -kx$$

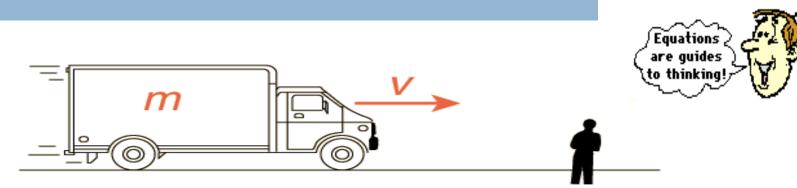

where *x* is the position of the block relative to $x_i = 0$ $x_f = x_{min}$ its equilibrium position (x = 0), and k is a positive constant called the force constant or the spring constant of the spring.

If the block undergoes a displacement from $x = x_i$ to $x = x_f$, the work done by the spring on the block is:

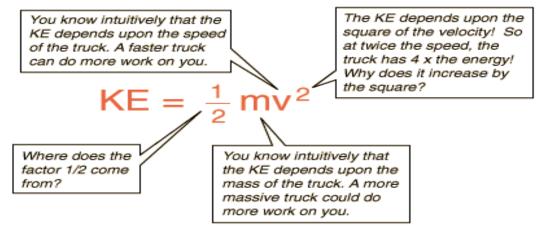

$$W_s = -\frac{1}{2} K (x_f^2 - x_i^2)$$

Kinetic Energy Concept

Energy which a body possesses because of its motion.

You know it's not a good idea to step out into the road right now because of the truck's kinetic energy. It can do work on you as a result of this "motion energy".

** Kinetic energy is a scalar quantity and has the same units as work.

Work – Kinetic Energy Theorem

$$W = \int_{x_i}^{x_f} \sum F \, dx = \int_{x_i}^{x_f} ma \, dx$$

$$W = \int_{v_i}^{v_f} mv \, dv$$

$$\sum W = \frac{1}{2} mv_f^2 - \frac{1}{2} mv_i^2$$

The total work done on an object is equal to its final kinetic energy minus the initial kinetic energy

Work – Kinetic Energy Theorem

 $\sum \mathbf{W} = \Delta \mathbf{K}$ $\sum \mathbf{W} = K_f - K_i$ $\sum \mathbf{W} = \frac{1}{2} m v_f^2 - \frac{1}{2} m v_i^2$

"In the case in which work is done on a system and the only change in the system is in its speed, <u>the work done by the net force</u> equals <u>the</u> <u>change in kinetic energy of the system."</u>

Potential Energy

Potential Energy of a System:

- Potential energy exists whenever an object which has mass has a position within a force field (gravitational, magnetic, electrical).
- > Is stored energy.
- is a scalar quantity
- > has the same units as kinetic energy and work .
- We will focus primarily on <u>gravitational potential energy</u> (energy an object has because of its height above the Earth) and <u>elastic potential energy</u> (energy stored in a spring)

1. Gravitational Potential Energy:

19

is the potential energy associated with
 gravitational force. The Potential Energy is

 $PE_g = m x g x y$

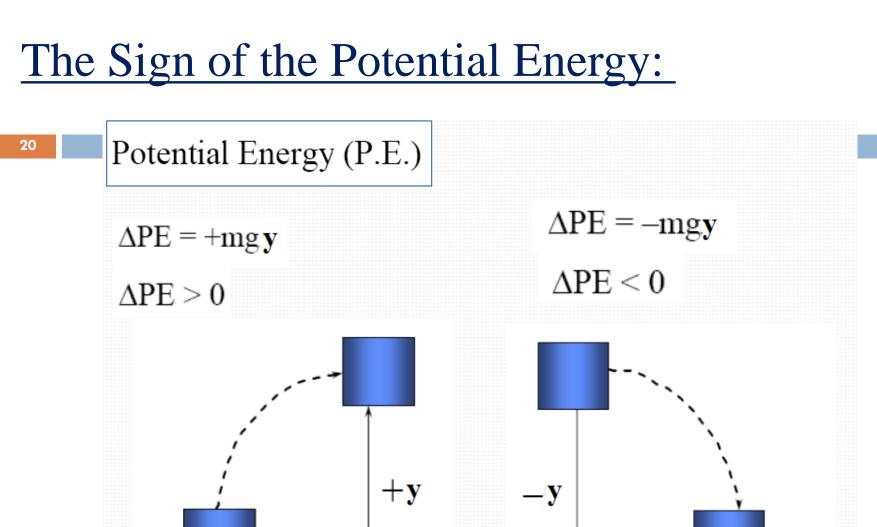

- m is mass in kilograms
- g is acceleration caused by gravity
- y is <u>vertical</u> distance it can fall in meters.

> Depends on mass and height.

(Remember (mg) is weight in N , so (mgy) is force times distance.)

Potential energy, like work and kinetic energy, is a scalar quantity & measured in the same unit (joule).

energy due to the change of position in gravitational field

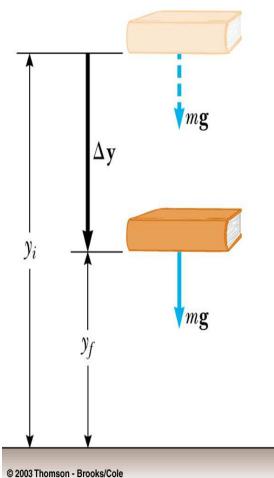

Gravitational Work & Gravitational Potential Energy

➤ The work done by the external force on the system (object and Earth) as the object undergoes downward displacement is given as

 W_g = - (PE_f - PE_i) = - ΔPE_g

21

➢ Explanation: If an object <u>falls</u> from one point to another inside a gravitational field, the force of gravity will do <u>positive work</u> on the object and the gravitational potential energy will<u>decrease</u> by the same amount.

2. Elastic Potential Energy:

22

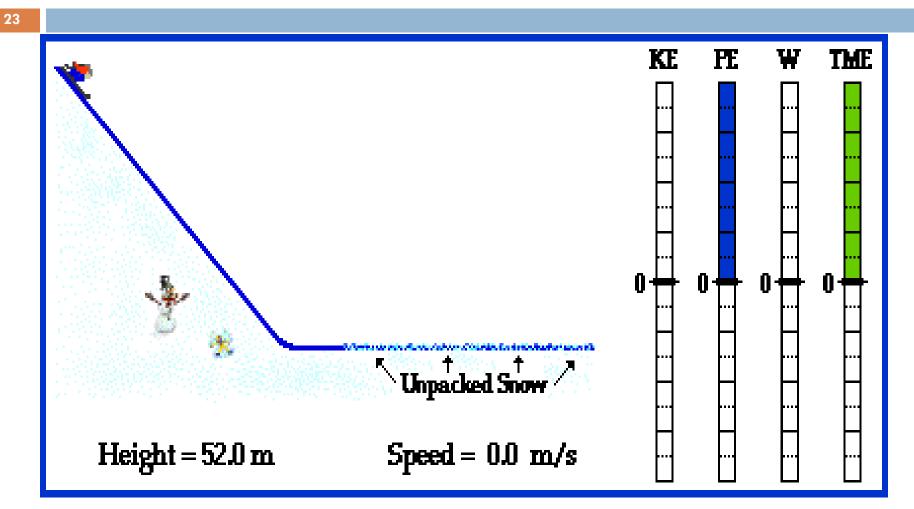

• We learned that the work done by a spring is given by:

$$W_{s} = -\frac{1}{2} k (x_{f}^{2} - x_{i}^{2})$$

The Elastic potential energy stored in a spring is defined by:

$$PE_{s} = \frac{1}{2} k x^{2}$$

The relationship between KE, PE & W & Total Mechanical Energy

Total Mechanical energy is due to its vertical position above the ground gravitational potential energy (TME = KE + PE)

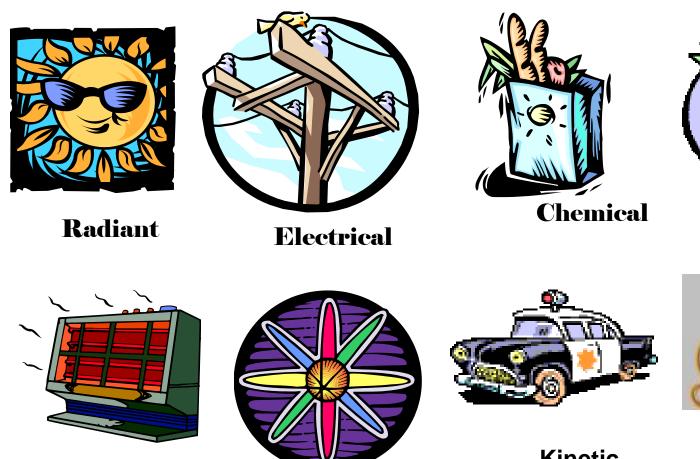

The Non Isolated System - Conservation of Energy

- Conservative forces: (closed loop net force = 0) Ex. : Gravity, electrical.... E_t (total energy)= KE + PE = constant
- $> Non-conservative forces: (net force \neq 0)$ Ex. Friction, air resistance... $E_t = KE + PE <math>\neq$ constant

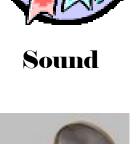

Non-conservative forces <u>still conserve</u> energy !! Energy just transfers to thermal energy.

Forms of Energy

Nuclear

Kinetic

Magnetic

Thermal

1. The Law of Conservation of Energy:

26

Energy in a system may take on various forms (e.g. kinetic, potential, heat, light).

Law of Conservation of Energy states that: Energy may neither be created nor destroyed. <u>Therefore</u>, the sum of all the energies in the system is a constant.

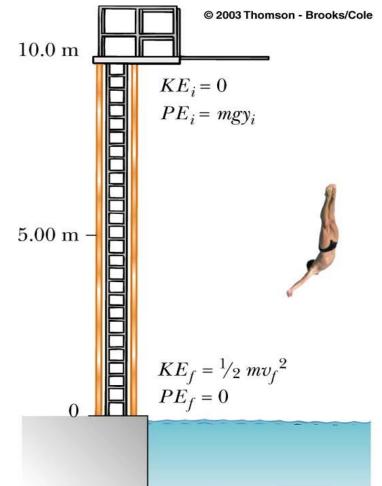

$$KE_i + PE_i = KE_f + PE_f$$
$$\frac{1}{2}mv_i^2 + mgy_i = \frac{1}{2}mv_f^2 + mgy_f$$

Example 4:

27

A diver of mass m drops from a board 10.0 m above the water surface, as in the Figure.

- a) Find his speed 5.00 m above the water surface. Neglect air resistance.
- b) Find his speed when he hits the water.

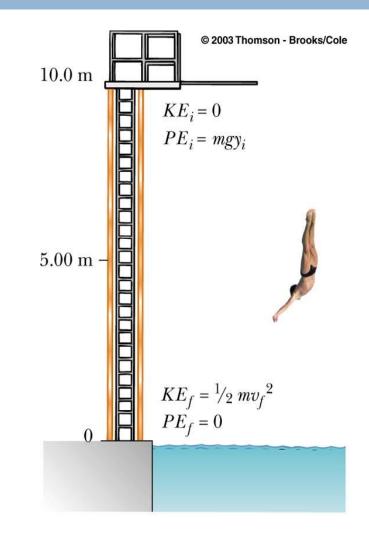

Example 4:

28

<u>Ans.:</u>

a) $KE_i + PE_i = KE_f + PE_f$ $\frac{1}{2}mv_i^2 + mgy_i = \frac{1}{2}mv_f^2 + mgy_f$ $0 + gy_i = \frac{1}{2}v_f^2 + gy_f$ $v_f = \sqrt{2g(y_i - y_f)}$ $= \sqrt{2(9.80m/s^2)(10.0m - 5.0m)} = 9.90m/s$

his speed 5.00 m above the water surface = 9.9 m/s

Example 4:

29

<u>Ans.:</u>

(b) Find his speed as he hits the water.

$$\frac{1}{2}mv_i^2 + mgy_i = \frac{1}{2}mv_f^2 + mgy_f$$
$$0 + mgy_i = \frac{1}{2}mv_f^2 + 0$$

$$v_f = \sqrt{2gy_i} = \sqrt{2(9.80m/s)^2(10.0m)} = 14.0m/s$$
