

# Chapter 4

## Gases II

### Lecture 7

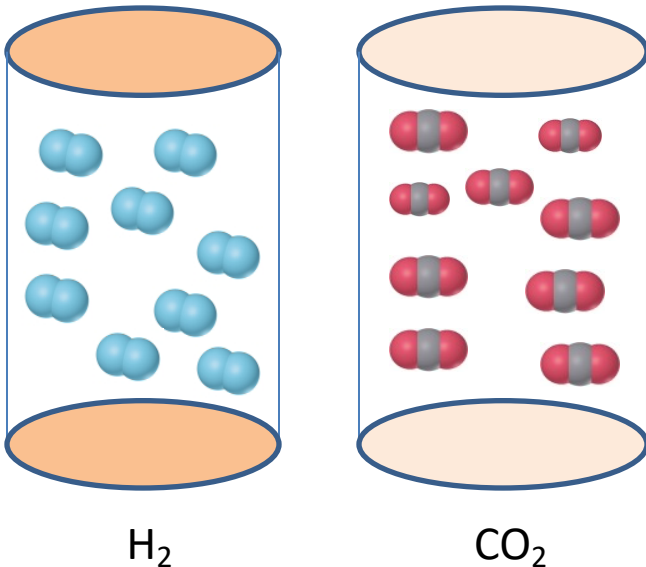

# Gay Lussac's Law

## Temperature- Pressure Relationship

- Gay Lussac's law states that "At constant volume, the pressure is directly proportional to the Kelvin temperature

$$\frac{\text{Pressure}}{\text{temperature}} = \text{constant} \quad \text{or} \quad \frac{P_1}{T_1} = \frac{P_2}{T_2}$$

**Avogadro's law.** Two equal tanks of gas of equal volume at the same temperature and pressure contain the same number of molecules.  $V=Cn$

# Combined Gas Law

Name	Expression	Constant
Boyle's law	$P_1V_1 = P_2V_2$	T
Charles's law	$\frac{V_1}{T_1} = \frac{V_2}{T_2}$	P
Gay-Lussac's law	$\frac{P_1}{T_1} = \frac{P_2}{T_2}$	V

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

# 5.4 Ideal Gas Equation

Boyle's law:  $V \propto \frac{1}{P}$  (at constant  $n$  and  $T$ )

Charles' law:  $V \propto T$  (at constant  $n$  and  $P$ )

Avogadro's law:  $V \propto n$  (at constant  $P$  and  $T$ )

$$V \propto \frac{nT}{P}$$

$$V = \text{constant} \times \frac{nT}{P} = R \frac{nT}{P} \quad R = \text{gas constant}$$

$$PV = nRT$$

## vii- The Gas Constant

- Repeated experiments show that at standard temperature (273 K) and pressure (1 atm), one mole (n=1) of gas occupies (22.4 L) volume. Using this experimental value, you can evaluate the gas constant R,

$$\begin{aligned} R &= \frac{P V}{n T} = \frac{1 \text{ atm } 22.4 \text{ L}}{1 \text{ mol } 273 \text{ K}} \\ &= 0.0821 \text{ L.atm / (mol.K)} \end{aligned}$$

- One mole of  $\text{CH}_4$  gas occupies 20.0 L at 1.00 atm pressure. What is the temperature of the gas in Kelvin?
- **Solution:**

$$PV = nRT$$

$$T = \frac{PV}{nR} = \frac{(1.00 \text{ atm})(20.0 \text{ L})}{(1.00 \text{ mol})(0.0821 \text{ L}\cdot\text{atm}\cdot\text{mol}^{-1}\text{K}^{-1})} = 244 \text{ K}$$

- If there is 5.0 g of  $\text{CO}_2$  gas in a 10 L cylinder at 350 K, what is the pressure of the gas in atm?
- **Solution**

$$? \text{ mol} = 5.0 \text{ g } \text{CO}_2 \times \frac{1 \text{ mol } \text{CO}_2}{44 \text{ g } \text{CO}_2} = 0.114 \text{ mol } \text{CO}_2$$

## 5.5 Dalton's Law

- "The total pressure of a gas mixture is the sum of the partial pressure of each gas
- **Partial pressure:**  $P_{total} = P_1 + P_2 + \dots$
- "It is the pressure of a single gas in the mixture as if that gas alone occupied the container."

Volume and temperature are constant

**Example:** to a tank containing  $\text{N}_2$  at 2.0 atm and  $\text{O}_2$  at 1.0 atm we add an unknown quantity of  $\text{CO}_2$  until the total pressure in the tank is 4.6 atm. What is the partial pressure of  $\text{CO}_2$ ?

**Solution:**

$$\begin{array}{ccccccc} 4.6 \text{ atm} & = & 2.0 \text{ atm} & + & 1.0 \text{ atm} & + & 1.6 \text{ atm} \\ \text{Total} & & \text{Partial} & & \text{Partial} & & \text{Partial} \\ \text{pressure} & & \text{pressure} & & \text{pressure} & & \text{pressure} \\ & & \text{of } \text{N}_2 & & \text{of } \text{O}_2 & & \text{of } \text{CO}_2 \end{array}$$

## Problem -1 *Ideal Gas Equation*

H.W

What is the volume of a gas balloon filled with 4.00 moles of He when the atmospheric pressure is 748 torr and the temperature is 30.°C?  
R= 0.082 L.atm/mol.K

$$n = 4 \text{ moles}$$

$$P = 748 \text{ torr} / 760 = \text{ atm}$$

$$T = 30.^\circ\text{C} + 273 \text{ K}$$

$$P V = n R T$$

## Problem -2

H.W

A helium-filled weather balloon has a volume of 7240 cubic feet. How many grams of helium would be required to inflate this balloon to a pressure of 745 torr at 21°C? (1 ft<sup>3</sup>=28.3 L)

# Solution

$$P V = n R T \quad , \quad n = PV/RT \quad , \quad \frac{m}{M} = \frac{PV}{RT} \quad , \quad m = \frac{PVM}{RT}$$

$$R = 0.082 \text{ L.atm/mol.K}$$

$$m = \frac{PVM}{RT}$$

$$m = \frac{0.980 \text{ atm} \times 204892 \text{ L} \times 4\text{g/mol}}{0.082 \text{ L.atm/mol.K} \times 294\text{K}}$$

$$m = 33315.77 \text{ g}$$

## Problem -3

H.W

Two tanks are connected by a closed valve. Each tank is filled with gas as shown, and both tanks are held at the same temperature. We open the valve and allow the gases to mix. After the gases mix, what is the partial pressure of each gas, and what is the total pressure?

# Solution

(a) For  $O_2$ ,

$$P_1V_1 = P_2V_2 \quad \text{or} \quad P_{2,O_2} = \frac{P_1V_1}{V_2} = \frac{24.0 \text{ atm} \times 5.00 \text{ L}}{8.00 \text{ L}} = 15.0 \text{ atm}$$

For  $N_2$ ,

$$P_1V_1 = P_2V_2 \quad \text{or} \quad P_{2,N_2} = \frac{P_1V_1}{V_2} = \frac{32.0 \text{ atm} \times 3.00 \text{ L}}{8.00 \text{ L}} = 12.0 \text{ atm}$$

The total pressure is the sum of the partial pressures.

$$P_{\text{total}} = P_{2,O_2} + P_{2,N_2} = 15.0 \text{ atm} + 12.0 \text{ atm} = 27.0 \text{ atm}$$

## Problem -4

A 120.-mL flask contained 0.345 gram of a gaseous compound at 100.°C and 1.00 atm pressure. What is the molecular weight of the compound?

$$P V = n R T \quad n = PV/RT \quad m/M = PV/RT$$

$$M/m = RT/PV \quad M = RTm/PV \quad R = 0.082 \text{ L.atm/mol.K}$$

$$M = \frac{0.082 \cancel{\text{L.atm}} \times (100 + 273.\text{K}) \cdot 0.345 \text{ g}}{\cancel{\text{mol.K}} \times 1.00 \cancel{\text{atm}} \times 0.120 \cancel{\text{L}}} = \frac{\text{g}}{\text{mol}}$$
